

Clarvista™ Glass LETS YOU ENJOY THE LASTING BEAUTY OF YOUR SHOWER.

When you choose a glass shower enclosure, you're making a commitment to the beauty of your bathroom. See why choosing the right shower glass can help you enjoy that beauty longer.

The lasting beauty of Clarvista glass.

It has a coating, fused to the glass, sealing the glass surface to provide a protective barrier. Which is why, with regular maintenance, shower enclosures built with any of the available varieties of Clarvista glass can keep their "like new" look longer. Take a look inside and see what makes Clarvista glass different – and why it should be the only glass you consider for your shower enclosure.

STANDS THE TEST
OF TIME.

Clarvista™ Glass
A PPG Industries Product

NOT ALL GLASS IS AS SMOOTH AS GLASS.

You can't tell by looking at it, or even by touching it, but glass is a surprisingly porous material at the microscopic level. Repeated exposure to the kind of heat, humidity and cleaning products that you'd find in a bathroom can cause corrosion. This corrosion can cause ordinary glass to change appearance –making your glass shower look cloudy. Even some products designed to guard against this corrosion still degrade over time.

Clarvista Glass IS DIFFERENT. It has a coating, fused to the glass, sealing the glass surface to provide a protective barrier. The coating withstands the high temperatures required to thermally temper (strengthen) glass to meet safety codes for shower enclosures. Which is why, with regular maintenance, shower enclosures built with any of the available varieties of Clarvista glass can keep their “like new” look longer.

Using powerful microscopic scanning technology, you can see how the surface of Clarvista Glass is much smoother than the surface of clear glass and even the surface of other leading shower glass products – especially after accelerated exposure testing.

DISCOVER THE REAL BEAUTY OF Clarvista™ Glass.

THE BEAUTY OF Clarvista Glass

To help you get a better look at the real beauty of Clarvista glass, we conducted accelerated heat and humidity testing to amplify the stresses a shower enclosure could endure. We put Clarvista glass up against ordinary uncoated clear glass and the leading shower enclosure glass.

After only 175 hours, tempered uncoated clear glass started to show signs of corrosion, and was significantly corroded at the end of the test.

As you can see from the photographs, tempered Clarvista glass looks like new. In fact, Clarvista glass has stood up to rigorous scratch and chemical resistance tests followed by 1,000 hours of exposure to accelerated heat and humidity tests in a corrosive environment. And the real beauty of Clarvista glass keeps shining through.

Normal uncoated glass, and even the leading coated shower glass, is susceptible to corrosion. And corrosion can make your shower enclosure look dull over time. The true beauty of the tough, smooth surface of Clarvista glass becomes apparent in its ability to resist the corrosive action of moisture, humidity and the chemicals found in many household cleaners. It has proven itself in the lab, and it will do so in your shower. So, with regular maintenance, your shower looks newer, longer. And that is a beautiful reason to choose Clarvista glass.

(A) CLARVISTA TEMPERED SHOWER GLASS
Haze after testing <1%

(B) LEADING COMPETITOR'S TEMPERED SHOWER GLASS
Haze after testing 12%

(C) UNCOATED CLEAR TEMPERED SHOWER GLASS
Haze after testing 77%

Note: Haze is a scientific measure of glass clarity. The lower the haze measure, the clearer your glass appears.
