Description

Mirrors are one of the cornerstone products in the development of Saand. This is the first product manufactured and fabricated in our Toronto plant. We carry a full range of mirror types varying in thickness and size and are able to meet custom mirror needs. Our readily available colours include clear, grey, bronze and low iron. Other colours available on request are black, green, blue and acid etched (low iron and regular clear). Saand is not tied to any single glass manufacturer which allows us to search the continent for the highest quality "selected for silvering" float glass available.

Capabilities

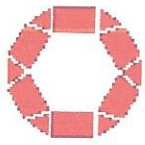

We carry a full range of mirror types, thicknesses and sizes, and are able to meet your custom mirror needs

Product Conforms to:

Industry standard ASTM 1503

Fabrication Guidelines

Products Features

Independent Mirror Product Sheet.

Independent Mirror has been manufacturing and supplying top quality mirrors in North America for the past 25 years. The company's customers include a wide variety of fabricators, original equipment manufacturers (OEM's) as well as glass and mirror distributors. We take pride in being a pioneer in the development of new technologies for mirror manufacture.

Silvering Process.

Different international standards are used to measure the quality of Mirrors Independent Mirror took a close look at all the standards, combined them with the latest mirror-making technologies and created a new benchmark in North American Mirror quality. That benchmark is called *Indicoat*.

Independent addressed today's environmental concerns with the *Indicoat* two coat low lead paint system which complies to TCLP requirements'. The combination of the two layers of thermally cured paint provides the best protection of the metal surfaces without compromising quality or raising environmental concerns.

Our Mirrors are durable and have excellent fabrication and resistance characteristics.

- **10 Year Warranty** Independent mirror warrants against defects and is covered by a written limited warranty.
- **Silvering Quality Glass.** Selection of glass is critical in the making of a beautiful mirror. Independent Mirror uses Silvering Selected Glass. Being an Independent Company we have the ability to select the best quality being produced from any of the major flat glass producers.
- **Two Coat Paint,** The same way one paints a base and then a top coat of paint on a wall we do the same on our mirrors producing a top quality smooth mirror backing.
The first coat has the properties designed for protection of metals and good adhesion. The second coat is designed to enhance surface protection and appearance. Using a two coat system allows for a better mirror.
- **Edge protection** is a concern of all fabricators of mirror. For as long as *indicoat* has been on the market (25 years) **there has never been a requirement for a separate edge protection to be applied.** Common sense and good fabricating practices on any glass products are always recommended.
- **Mastics** We have never had any complaints or issues on any of the commonly used mirror mastics. It is always recommended that these be applied in accordance with acceptable glazing practices.
